This work is devoted to the study of the Spanish economy. The goal is to know what has happened and what will happen to the most important economic variables. A specific study on the past behavior of each variable was also carried out, with particular emphasis from the end of 2008, date in which you begin to notice the crisis. Predictions obtained from the statistical analysis of time series are necessary to describe the future behavior of the Spanish economy instrument. Finally, this information is used to study the adequacy of the Phillips curve to capture the behavior of inflation and unemployment in Spain. In this respect the results are consistent with the predictions of the theory.

Materias o Palabras Clave (máximo 5) / Gaiak edo hitz gakoak (gehienetz 5)

Economy, rate of growth, Phillips curve, predictions, Economic crisis.
