Supplementary Information for

## Political equality and quality of government

Roberto Ezcurra and Izaskun Zuazu

Kyklos, Vol. 75 (2022), No. 2

## A1 Data

## A1.1 Political equality

As pointed out in section 3, the V-Dem measure of political equality used in the paper is based on the information provided by numerous country experts, who code one or several countries according to expertise. Before being asked about how political power is distributed across income groups, country experts receive the following instructions (Coppedge et al., 2018a, p. 186):

#### Abstract

This section pertains to political equality, that is, the extent to which members of a polity possess equal political power. It does not refer to the inevitable differentiation in power that occurs in all large societies between those who hold positions of power within the state (political elites) and lay citizens. It is, rather, about the distribution of political power among identifiable groups within the population. What does it mean for a group of individuals to wield real political power? AIthough political power cannot be directly observed, one can infer that groups possess power to the extent that they: (a) actively participate in politics (by voting, etc.), (b) are involved in civil society organizations, (c) secure representation in government, (d) are able to set the political agenda, (e) influence political decisions, and (f) influence the implementation of those decisions. Please consider all these factors when answering the following questions. (Of course, the picture across these different dimensions may be mixed; your response should indicate the overall picture, taking all aspects of political power into account.)

Country experts must then answer the following question (Coppedge et al., 2018a, p. 186):

Question: Is political power distributed according to socioeconomic position?

Clarification: All societies are characterized by some degree of economic (wealth and income) inequality. In some societies, income and wealth are distributed in a grossly unequal fashion. In others, the difference between rich and poor is not so great. Here, we are concerned not with the degree of social inequality but rather with the political effects of this inequality. Specifically, we are concerned with the extent to which wealth and income translates into political power.

Responses:

0: Wealthy people enjoy a virtual monopoly on political power. Average and poorer people have almost no influence.

1: Wealthy people enjoy a dominant hold on political power. People of average income have little say. Poorer people have essentially no influence.

2: Wealthy people have a very strong hold on political power. People of average or poorer income have some degree of influence but only on issues that matter less for wealthy people.

3: Wealthy people have more political power than others. But people of average income have almost as much influence and poor people also have a significant degree of political power.

4: Wealthy people have no more political power than those whose economic status is average or poor. Political power is more or less equally distributed across economic groups.

As described in section 3, the ratings provided by country experts are aggregated using a measurement model based on Bayesian item response theory (IRT) modeling techniques, which produces a probability distribution over country-year scores on a standardized interval scale. See Coppedge et al. (2018b) for further details.

## A1.2 Quality of government

The four WGI measures used to construct our main index of quality of government are defined as follows (Kaufmann et al., 2010, p. 223):

- Government effectiveness: Measuring perceptions of the quality of public services, the quality of the civil service and the degree of its independence from political pressures, the quality of policy formulation and implementation, and the credibility of the government's commitment to such policies.
- Regulatory quality: Measuring perceptions of the ability of the government to formulate and implement sound policies and regulations that permit and promote private sector development.
- Rule of law: Measuring perceptions of the extent to which agents have confidence in and abide by the rules of society, and in particular the quality of contract enforcement, property rights, the police, and the courts, as well as the likelihood of crime and violence.
- Control of corruption: Measuring perceptions of the extent to which public power is exercised for private gain, including both petty and grand forms of corruption, as well as "capture" of the state by elites and private interests.

## A1.3 Control variables

We now present the definitions and sources of the different control variables used throughout the paper:

- Democracy (polity2): Democracy index ranging between -10 (full autocracy) and 10 (full democracy). The index is based on information about the degree of competitiveness and openess of elections, the nature of political participation in general, and the extent of checks on executive authority. Source: Polity IV Project.
- Democracy (Vanhanen's index): Vanhanen's index of democracy. The index is obtained by combining data on political participation and electoral competition. Source: V-Dem dataset.
- Economic inequality: Gini index calculated using data on household disposable (post-tax, post-transfer) income. Source: Standardized World Income Inequality Database (SWIID).
- Legal origins: Set of dummy variables that identify the legal origin of the Company Law or Commercial Code of a country. The four legal origins considered are: (i) English Common Law, (ii) French Commercial Code, (iii) German legal origin, and (iv) Socialist or Communist Laws. Source: Ashraf and Galor (2013).
- Former colony: Dummy variable that takes the value of one if the country is a former European colony, zero otherwise. Source: Own elaboration based on data drawn from Nunn and Puga (2012).
- Protestant: Share of Protestants in the total population in the year 2000. Source: Barro and McCleary (2003).
- Catholic: Share of Roman Catholics in the total population in the year 2000. Source: Barro and McCleary (2003).
- Muslim: Share of Muslims in the total population in the year 2000. Source: Barro and McCleary (2003).
- Latitude: Absolute value of the latitude of a country's approximate geodesic centroid. Source: Ashraf and Galor (2013).
- Surface: Natural log of a country's total area, including areas under inland bodies of water and some coastal waterways. Source: World Development Indicators (World Bank).
- Elevation: Mean elevation of a country in kilometres above sea level, calculated using geospatial data. Source: Ashraf and Galor (2013).
- Roughness: Degree of terrain roughness of a country, calculated using geospatial data. Source: Ashraf and Galor (2013).
- Ethnolinguistic fractionalization: Index of ethnolinguistic fractionalization that captures the probability that two individuals randomly drawn from the population belong to different ethnolinguistic groups. See Desmet et al. (2012) for further details. Although Desmet et al. (2012) consider different levels of aggregation of linguistic groups in a country's population (based on hierarchical linguistic trees), the specific fractionalization measure used in our analysis is the one corresponding to their most disaggregated level. Source: Desmet et al. (2012).
- Ethnolinguistic polarization: Index of ethnolinguistic polarization that quantifies the extent to which the ethnolinguistic composition of a country's population resembles a perfectly polarized distribution, in which the national population is composed of two groups of equal size. See Desmet et al. (2012) for further details. Although Desmet et al. (2012) consider different levels of aggregation of linguistic groups in a country's population (based on hierarchical linguistic trees), the specific polarization measure used in our analysis is the one corresponding to their most disaggregated level. Source: Desmet et al. (2012).
- GDP per capita: Natural log of GDP per capita based on purchasing power parity (PPP). Data are in constant 2011 international dollars. Source: World Development Indicators (World Bank).
- Natural resources: Total natural resources rents expressed as a percentage of GDP. Source: World Development Indicators (World Bank).
- Globalization: KOF globalization index. The index is constructed using different variables that capture the economic, social and political dimensions of globalization. See Dreher (2006) for further details. Source: Dreher (2006).
- Education: Measure which captures to what extent is high quality basic education guaranteed to all, sufficient to enable them to exercise their basic rights as adult citizens. Basic education refers to ages typically between 6 and 16 years of age but this varies slightly among countries. The method used to construct this variable is similar to that described in section 3 in relation to the measure of political equality. See Coppedge et al. (2018a) for further details. Source: V-Dem dataset.

|  |  |  |  |  |  |

Notes: See section A1.1 for further details on the definition of the measures of political equality and quality of government. The value of the measure of political equality is the average of the period 2005-2010. The value of the measure of quality of government is the average of the period 2011-2015.

Notes: The estimation considers the underlying uncertainty in the inequality measures introduced by the multiple imputation procedures used by Solt (2016) in order to reduce the number of missing values in the SWIID data set. The dependent variable is in all cases the measure of quality of government described in section 3. Robust standard errors in parentheses. * Significant at the $10 \%$ level, ** significant at the 5\% level, *** significant at the $1 \%$ level.
