Online Appendix for "Gender Differences in

## Alternating-Offer Bargaining: An Experimental Study" BY

 Hernandez-Arenaz, I. and Iriberri, N.
## A Appendix: Additional Figures and Tables

Figure A1- Gender Nature of the Real Effort Task

Notes: Histogram for perceived gender nature of the task by gender.

Figure A2- GEnder Nature of the Bargaining

Notes: Histogram for perceived gender nature of bargaining by gender.

Figure A3- Histogram of Responder’s Pie Share by Treatments

Notes: Histogram for Responder's Pie Share by treatment.

Figure A4- Deadline Effect

Notes: Distribution of the last proposals (offer or demand) over time in seconds. Total refers to the total number of pairings that made their last proposal in a given time window. An Agreement refers to the number of pairings that made their last proposal in a given time window and are accepted.

Table A1- Descriptive Statistics

|  | Women (N=284) <br> $(1)$ | Men (N=278) <br> $(2)$ | $p$-value <br> $(3)$ |
| :--- | :---: | :---: | :---: |
| Self-Assessed Rank (Task) | 2.26 | 2.09 | 0.0234 |
|  | $(0.93)$ | $(0.92)$ |  |
| Real Rank (Task) | 2.44 | 2.40 | 0.6904 |
|  | $(1.11)$ | $(1.11)$ |  |
| Real-Self-Assessed Rank (Task) | 0.17 | 0.31 | 0.0782 |
|  | $(1.02)$ | $(0.86)$ |  |
| Self-Assessed Rank (Bargaining) | 2.64 | 2.43 | 0.0063 |
|  | $(0.88)$ | $(0.93)$ |  |
| Real Rank (Bargaining) | 2.53 | 2.49 | 0.6537 |
|  | $(1.11)$ | $(1.13)$ |  |
| Real-Self-Assessed Rank (Bargaining) | -0.11 | 0.06 | 0.0432 |
|  | $(0.96)$ | $(0.99)$ |  |
| Risk Preferences | 3.34 | 4.17 | 0.0000 |
| SVO angle | $(1.74)$ | $(2.07)$ |  |
|  | 20.06 | 20.88 | 0.4857 |

[^0]Table A2- Mean Values of Ambiguity by Treatment and Pie

|  | Dist_Mean |  |  |  | Dist_Mode |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Pie=5 | Pie=10 | Pie=15 | Overall | Pie=5 | Pie=10 | Pie=15 | Overall |
| Symmetric | 0.040 | 0.049 | 0.060 | 0.050 | 0.030 | 0.045 | 0.052 | 0.042 |
| Empowerment | 0.086 | 0.089 | 0.110 | 0.096 | 0.091 | 0.117 | 0.119 | 0.108 |
| Empowerment with past agreements | 0.079 | 0.068 | 0.089 | 0.080 | 0.072 | 0.067 | 0.090 | 0.078 |
| Entitlement | 0.090 | 0.073 | 0.065 | 0.077 | 0.091 | 0.078 | 0.065 | 0.079 |
| Entitlement with past agreements | 0.073 | 0.057 | 0.058 | 0.062 | 0.070 | 0.050 | 0.057 | 0.058 |
| Information | 0.070 | 0.114 | 0.100 | 0.097 | 0.054 | 0.150 | 0.187 | 0.137 |
| Overall | 0.073 | 0.076 | 0.082 | 0.077 | 0.068 | 0.086 | 0.095 | 0.084 |

Notes: Mean values for the two ambiguity measures, by treatment and pie: Dist_Mean and Dist_Mode for successful agreements. Dist_Mean is the absolute difference between the responder's share and the mean value of the responder's share by treatment and pie. Dist_Mode is the absolute difference between the responder's share and the mode of the responder's share by treatment and pie.

Table A3- Expectations and Semi-Elasticities

|  |  |  |
| :--- | :---: | :---: |
| $E(y \mid X)$ | $\Phi(X \gamma)[X \beta+\sigma \lambda(X \beta / \sigma)]$ |  |
| $P(y>0 \mid X)$ | $\Phi(X \gamma)$ |  |
| $E(y \mid X, y>0)$ | $X \beta+\sigma \lambda(X \beta / \sigma)$ |  |
| $S_{j}(y)=\frac{\partial E(y \mid X) / \partial x_{j}}{E(y \mid X)}$ | $\gamma_{j} \lambda(X \gamma)+\frac{\beta_{j} \theta(X \beta / \sigma)}{X \beta+\sigma \pi(X \beta / \sigma)}$ | Total Effect |
| $S_{j}(P=1)=\frac{\partial P(y>0 \mid X) / \partial x_{j}}{P(y>0 \mid X)}$ | $\gamma_{j} \lambda(X \gamma)$ | Extensive Margin |
| $S_{j}(y>0)=\frac{\partial E(y X, y>0) / \partial x_{j}}{E(y \mid X, y>0)}$ | $\frac{\beta_{j} \theta(X \beta / \sigma)}{X \beta+\sigma \lambda(X \beta / \sigma)}$ | Intensive Margin |

Notes: $\Phi($.$) denotes the cumulative normal distribution function, \phi($.$) its density function, \lambda()=.\frac{\phi(.)}{\Phi(.)}$ the inverse Mills ratio, and $\theta(z)=$ $1-\lambda(z)[z+\lambda(z)]$. Coefficients from the probit are denoted by $\gamma$, and coefficients from the truncated normal regression by $\beta . \sigma$ is the standard deviation of the random component $\epsilon$.

Table A4- Gender Differences: Aggregate Results with Individual Controls

| $S_{z}(P=1)$ | Proposer's Outcomes |  | Responder's Outcomes |  |
| :---: | :---: | :---: | :---: | :---: |
|  | $S_{z}(y \mid y>0)$ <br> (2) | $\begin{gathered} S_{z}(y) \\ \text { (3) } \end{gathered}$ | $S_{z}(y \mid y>0)$ <br> (4) | $\begin{gathered} S_{z}(y) \\ \text { (5) } \end{gathered}$ |

Notes: Cragg's truncated hurdle model for the earnings captured by the proposer (Panel A) and by the responder (Panel B) in each bargaining environment. Semi-elasticities are reported. All regressions control for Pie Size, Period, and Session fixed effects as well as individual controls. Individual level controls include subjects' risk and social preferences and their self-assessed ability levels in the real effort task and in bargaining ability, separately for Proposers and Responders. Standard errors clustered at subject level using two-way clustering in parentheses. Romano-Wolf multiple hypothesis corrected $p$-values in brackets with 1,000 bootstrap replication. *** $\mathrm{p}<0.01, * * \mathrm{p}<0.05$, * $\mathrm{p}<0.1$ for standard $p$-values. ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$ for Romano-Wolf multiple hypothesis corrected $p$-values.

## B Appendix: Instructions

## B. 1 General Instructions

THANK YOU FOR PARTICIPATING IN THE EXPERIMENT!

We are going to start the experiment. From now on it is not allowed to talk, to look at what other participants are doing or to walk around. Please, switch off your mobile phone. If you have any question or you need help, raise your hand and one of the researchers will assist you. If you do not follow these instructions YOU WILL BE ASKED TO LEAVE THE EXPERIMENT AND YOU WILL NOT GET ANY PAYMENT. Thank you.

The University of the Basque Country has provided the funds for this experiment. The quantity you can earn depends on your decisions, the decisions of other participants as well as on luck.

Experimental stages and tasks: The experiment consists of 3 stages:

In the first stage, you will see matrices with " 0 "s and " 1 "s during 5 minutes. Your task consist in counting the number of " 1 "s in each matrix. The number of correct answers that you provide will determine your productivity which will be relevant for the next part of the experiment.

In the second stage of the experiment, the computer will randomly match you with another partner and your task will consist of dividing an amount of money through a bargaining. This quantity depends on your productivity and the productivity of the participant you are matched with. You will have 3 minutes for each negotiation. There will be 10 bargaining rounds in which you will be matched with a different participant each time.

In the third stage you will be presented with three short tasks in which you can earn more money.

## Earnings:

You have 3 euro for sure. In addition, in the second stage of the experiment, once the experiment had concluded, the computer will choose two bargaining rounds randomly and you will be paid the amount you had earned in each of those. Finally, in the third stage you can earn extra money for each of the three short tasks. Therefore, at the end of the experiment your final earnings will be the sum of the 3 euro you get for participating, plus your earnings in the two bargaining rounds randomly selected, plus your earnings in each of the short tasks from stage 3 . Your earnings will be paid in cash privately at the end of the experiment.

We will now start with the experiment. At the beginning of each stage, we will include detailed information about the task, the decisions as well as about earning.

## B. 2 Real Effort Task

In the stage, you will see matrices with " 0 "s and " 1 "s, similar to the ones displayed below, during 5 minutes.

Your task consists of counting the number of " 1 "s in each matrix. The size of the matrices will vary. Once you introduce an answer for one matrix and press the bottom "OK", the next matrix will appear. All participants will see the same matrices in the same order. There is a maximum of 60 matrices.

Example 1: 8x8 Matrix, Solution $=30$

| 1 | 1 | 0 | 1 | 0 | 1 | 1 | 0 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 0 | 1 | 0 | 1 | 0 | 1 | 1 |
| 0 | 0 | 1 | 0 | 1 | 0 | 1 | 1 |
| 0 | 0 | 0 | 0 | 0 | 1 | 1 | 0 |
| 0 | 0 | 0 | 0 | 1 | 0 | 1 | 0 |
| 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
| 0 | 0 | 0 | 1 | 1 | 0 | 1 | 0 |
| 0 | 0 | 1 | 1 | 1 | 1 | 1 | 1 |

Example 2: $6 \times 6$ Matrix, Solution $=16$

| 1 | 0 | 0 | 0 | 1 | 1 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 1 | 0 | 0 | 0 | 1 | 0 |
| 0 | 0 | 0 | 1 | 0 | 0 |
| 1 | 0 | 0 | 1 | 0 | 0 |
| 1 | 1 | 0 | 0 | 1 | 1 |
| 1 | 1 | 1 | 1 | 0 | 0 |

The number of correct answers that you provide will determine your productivity. The higher your productivity the higher will be, on average, the amount of money you will have to divide in the next stage.

## B. 3 Bargaining Stage: Symmetric

In this stage you will be matched randomly with another participant and your task consists of dividing an amount of money through a bargaining. This amount can be $€ 5, € 10$ or $€ 15$.

HOW IS COMPUTED THE AMOUNT OF MONEY TO BE DIVIDED?

It will proceed in the following way:

1. The number of correct answers in the first stage will determine the productivity of each participant in the following way:

- Bottom third: Those participants with the lowest number of correct answers will have a productivity of $€ 5$
- Intermediate third: Those participants with an intermediate number of correct answers will have a productivity of $€ 10$
- Top third: Those participants with the highest number of correct answers will have a productivity of $€ 15$

2. In each round, you will be randomly matched with another participant and the amount to be divided will be:

- YOUR PRODUCTIVITY with a $50 \%$ chance
- THE PRODUCTIVITY OF THE PARTICIPANT YOU ARE MATCHED WITH with a $50 \%$ chance

For example, if your productivity is $€ 5$ and the productivity of the other participant is $€ 15$, the amount to be divided will be $€ 5$ with a $50 \%$ chance and $€ 15$ with a $50 \%$ chance. Finally, if you and the participant with whom you are matched have the same productivity of 5,10 , or 15 euro, then the amount to be divided will be 5,10 and 15 euro respectively.

## WHAT DECISIONS CAN BE TAKEN DURING A BARGAINING?

Before starting, for each couple, you will be told whether you are participant A or participant B. During the negotiation you will have to decide HOW MUCH MONEY WILL GET PARTICIPANT B, such that if you are participant A you will make offers to participant B and if you are the participant B you will make demands from participant A.

The negotiation works in the following way:

- Participant A will start the negotiation with a first offer, deciding how much money participant A wants to offer to participant $B$.
- Participant B can accept or reject that offer. If the offer is accepted, participant B will get the amount offered and participant A will get the pie to be divided minus the amount offered to participant $B$.
- If the offer is rejected, the bargaining continues and it will be the turn of participant $B$ to make a demand from participant A , deciding how much money participant B wants to get.
- Participant A can accept or reject that demand. If the demand is accepted, participant B will get the amount demanded and participant A will get the pie to be divided minus the amount demanded by participant B.
- If the demand is rejected, the bargaining continues and it will be the turn of participant A to make a new offer to participant B. And so on and so forth.

Offers and demands have to be multiples of $€ 0.1$ ( 10 cents). You will have a total of 3 minutes to reach a deal. If during this time you do not reach a deal, both participants will get $€ 0$.

There will be 10 different bargaining rounds where you will be matched with a different participant each time. During each negotiation you will be informed about the amount of money you have to divide, if you are participant $A$ or participant $B$, of the remaining time left for the 3 minutes, as well as on the complete bargaining record: offers made by A , demands made by B and whether they have been accepted or rejected.

For payment, at the end of the experiment, the computer will choose two bargaining rounds randomly, one between rounds 1 and 5 and another between rounds 6 and 10, and you will be paid according to the
deal you have reached in those negotiation rounds or $€ 0$ in case that you did not reach a deal.

## B. 4 Bargaining Stage: Empowerment

[. . . ] If during this time you do not reach a deal,
participant A will get an amount of money for sure, while participant B will get $€ 0$. The amount of money that participant A gets, is a randomly chosen amount between $50 \%$ and $85 \%$ of the amount to be divided.

That is, in case in which you do not reach a deal within the 3 minutes, participant A will get:

- Between $€ 2.5$ and $€ 4.25$ if the amount to be divided is $€ 5$
- Between $€ 5$ and $€ 8.5$ if the amount to be divided is $€ 10$
- Between $€ 7.5$ and $€ 12.75$ if the amount to be divided is $€ 15$

The exact amount will be randomly chosen by the computer once the negotiation had finished.
[...] At the end of the experiment, the computer will choose two bargaining round randomly, one between rounds 1 and 5 and another between rounds 6 and 10, and you will be paid according to the deal you have reached in those negotiation rounds or a positive amount if you are participant $A$ and $€ 0$ if you are participant $B$ in case that you did not reach a deal.

## B. 5 BARGAINING StAGE: EMPOWERMENT WITH PAST AGREEMENTS

Finally, you will be provided with the information on the most frequent agreed amount for the participant $B$ in the previous sessions.

## B. 6 Bargaining Stage: Entitlement

[...] as well as on the complete bargaining record: offers made by A, demands made by B and whether they have been accepted or rejected.

In addition, you will know your productivity and the productivity of the participant with whom you are matched, so you could learn whether the amount to divide corresponds to your productivity or to the productivity of the participant with whom you are matched.

## B. 7 BARGAINING StAGE: ENTITLEMENT WITH PAST AGREEMENTS

Finally, you will be provided with the information on the most frequent agreed amount for the participant $B$ in the previous sessions.

## B. 8 Bargaining Stage: Information

[...] There will be 10 different bargaining rounds where you will be matched with a different participant each.

During each negotiation only the participant A will observe the amount to be divided while the participant B will only know that this amount can be 5,10 or 15 euro, but not the exact amount. The participant A cannot accept demands that are higher than the amount of money to be divided.

## B. 9 Elicitation TASKS

This stage of the experiment consists of three short tasks with which you can earn extra money. The first one consists of answering four different questions regarding this session. In the second and in the third you will have to choose among different options.

As you will progress in this third stage of the experiment, we will provide you with more detailed instructions about each task.

## TASK I:

Next you will be asked 4 questions relative to this session. At the end of the experiment the computer will choose one of them randomly and you will be paid $€ 1$ if the answer you have provided is correct according to the data we have gather during the session and $€ 0$ otherwise.

QUESTION 1: If we sort all participants in this session from lowest to highest number of correct answers in stage 1 (counting " 1 "s), and we divide all subjects in 4 segments of equal size such that the participants with highest scores are in the first segment, the next in the second, the next in the third and the ones with lowest in the fourth segment, in which segment do you think you will be?

Options: $1^{\text {st }}$ segment $/ 2^{\text {nd }}$ segment $/ 3^{\text {rd }}$ segment $/ 4^{\text {th }}$ segment

QUESTION 2: On average, who do you think has performed better in the task from stage 1 (counting " 1 "s)?

Options: Men/No differences/Women

QUESTION 3: In each negotiation, a participant could get between $0 \%$ and $100 \%$ of the amount of money to be divided. If we sort all participants in this session from lowest to highest share of money that on average has obtained during the 10 negotiations, and we divide all the subjects in 4 segments of equal size such that the participants who obtained on average the highest share of money are in the first segment, the next in the second, the next in the third and the ones with lowest in the fourth segment, in which segment do you think you will be?

Options: $1^{\text {st }}$ segment $/ 2^{\text {nd }}$ segment $/ 3^{\text {rd }}$ segment $/ 4^{\text {th }}$ segment

QUESTION 4: On average, who do you think has obtained a higher share of the money during the negotiations?

Options: Men/No differences/Women

## TASK II:

On the next screen you will be presented with 8 different options, each of which offers two different quantities that you can win by choosing that option. In all the options, each outcome has a probability of $50 \%$, i.e., the result of choosing an option depends exclusively on luck. At the end of the experiment the computer will randomly pick one result from the option you have chosen and you will be paid accordingly.

Below this text you will find the 8 available options. To see in more detail how to read this table, consider option 5. In this option the possible results are $€ 0.7$ and $€ 2.7$. Both are equally likely, which means that the computer will choose $€ 0.7$ as the payment on one of every 2 occasions and $€ 2.7$ the other.

You must choose one of the 8 possible options. To that end, an empty box will appear where you must
enter the number of the option (from 1 to 8) that you want to choose.

|  | Probability 50\% | Probability $50 \%$ |
| :---: | :---: | :---: |
| 1 | $€ 1.5$ | $€ 1.5$ |
| 2 | $€ 1.3$ | $€ 1.8$ |
| 3 | $€ 1.1$ | $€ 2.1$ |
| 4 | $€ 0.9$ | $€ 2.4$ |
| 5 | $€ 0.7$ | $€ 2.7$ |
| 6 | $€ 0.6$ | $€ 2.8$ |
| 7 | $€ 0.4$ | $€ 2.9$ |
| 8 | $€ 0$ | $€ 3$ |

## TASK III:

Next, you will be matched randomly with another participant in this room. You will be presented with 6 situations in which you will have to choose one from among 9 options. Each option represents the quantity of money that you can earn from this task as well as the quantity of money that can earn the participant with whom you are matched.

At the end of the task, one participant in the matching will be randomly selected as Decider and the other as Receiver. The computer will randomly select one of the 6 situations and the payment you will get is the following:

- If you are the Decider, you will obtain what you have chosen for yourself in the situation selected by the computer
- If you are the Receiver, you will obtain what the other participant have chosen for you in the situation selected by the computer

The quantities displayed represent cents of euro.

[^0]:    Notes: Mean values and standard deviations (in parentheses) for individual control variables by gender. Self-Assessment (Task) refers to the self-reported rank in the real effort task and takes values 1 (top quartile) to 4 (bottom quartile). Real Rank (Task) refers to the real rank in the real effort task and takes values 1 (top quartile) to 4 (bottom quartile). Real-Self-Assessed Rank (Task) refers to the difference between the real and the self-assessed rank in the real effort task. Self-Assessment (Bargaining) refers to the self-reported rank in bargaining and takes values 1 (top quartile) to 4 (bottom quartile). Real Rank (Bargaining) refers to the real rank in bargaining and takes values 1 (top quartile) to 4 (bottom quartile). Real-Self-Assessed Rank (Bargaining) refers to the difference between the real and the self-assessed rank in bargaining. Risk Preferences takes values 1-8, with lowest numbers indicating greater risk aversion. SVO angle is the SVO angle from ?. Column (3) displays the $p$-value from a two-tailed $t$-test on the equality of means by gender.

[^1]:    Notes: Cragg's hurdle model for the pie share captured by the proposer and by the responder. Semi-elasticities are reported. $S_{z}(P=1)$ in column (1) refers to the effect of gender in the probability of reaching a deal. $S_{z}(y \mid y>0)$ in columns (2) and (4) refers, for the proposer and the responder outcomes respectively, to the effect of gender in the share captured conditional on reaching a deal. $S_{z}(y)$ in columns (3) and (5) refers, for the proposer and the responder outcomes respectively, to the effect of gender in the overall share captured (including fail negotiations) such that $S_{z}(y)=S_{z}(P=1)+S_{z}(y \mid y>0)$. All regressions control for each bargaining environment, Pie Size, Period, and Session fixed effects as well as individual controls. Individual level controls include subjects' risk and social preferences and their self-assessed ability levels in the real effort task and in bargaining ability, separately for Proposers and Responders. All fixed effects and individual controls are interacted with each bargaining environment. Direct effects displayed in bold. Standard errors are clustered at subject level using two-way clustering. Romano-Wolf multiple hypothesis corrected $p$-values in brackets with 1,000 bootstrap replication. $* * * \mathrm{p}<0.01, * * \mathrm{p}<0.05$, * $\mathrm{p}<0.1$ for standard $p$-values. ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$ for Romano-Wolf multiple hypothesis corrected $p$-values.

[^2]:    Notes: Decomposition of the overall effect displayed in Table A6 into the probability of reaching a deal ( $S_{z}(P=1)$, Panel A) and earnings conditional to reaching a deal $\left(S_{z}(y \mid y>0)\right.$ for the proposer (Panel B1) and the Responder (Panel B2). Semi-elasticities are reported such that $S_{z}(y)=S_{z}(P=1)+S_{z}(y \mid y>0)$. All regressions control for Pie Size, Period, and Session fixed effects. Individual level controls include subjects' risk and social preferences and their self-assessed ability levels in the real effort task and in bargaining ability, separately for Proposers and Responders. Standard errors clustered at subject level using two-way clustering in parentheses. Romano-Wolf multiple hypothesis corrected $p$-values in brackets with 1,000 bootstrap replication. ${ }^{* * *} \mathrm{p}<0.01$, ${ }^{* *} \mathrm{p}<0.05$, * $\mathrm{p}<0.1$ for standard $p$-values. ${ }^{a} \mathrm{p}<0.01$, ${ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$ for Romano-Wolf multiple hypothesis corrected $p$-values

[^3]:    Notes: Decomposition of the overall effect displayed in Table A8 into the probability of reaching a deal ( $S_{z}(P=1)$, Panel A) and earnings conditional to reaching a deal $\left(S_{z}(y \mid y>0)\right.$ for the proposer (Panel B1) and the Responder (Panel B2). The sample includes only the 2,137 negotiations in which no subject mentions gender as an objective of the experiment. Semi-elasticities are reported such that $S_{z}(y)=S_{z}(P=$ 1) $+S_{z}(y \mid y>0)$. All regressions control for Pie Size, Period, and Session fixed effects. Standard errors clustered at subject level using two-way clustering in parentheses. Romano-Wolf multiple hypothesis corrected $p$-values in brackets with 1,000 bootstrap replication. *** $\mathrm{p}<0.01,{ }^{* *} \mathrm{p}<0.05$, * $\mathrm{p}<0.1$ for standard $p$-values. ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$ for Romano-Wolf multiple hypothesis corrected $p$-values

[^4]:    Notes: Decomposition of the overall effect displayed in Table A12 into the probability of reaching a deal ( $S_{z}(P=1)$, Panel A) and earnings conditional to reaching a deal $\left(S_{z}(y \mid y>0)\right.$ for the proposer (Panel B1) and the Responder (Panel B2). The sample excludes from the analysis those negotiations closed within the last 10 seconds. Semi-elasticities are reported such that $S_{z}(y)=S_{z}(P=1)+S_{z}(y \mid y>0)$. All regressions control for Pie Size, Period, and Session fixed effects. Standard errors clustered at subject level using two-way clustering in parentheses. Romano-Wolf multiple hypothesis corrected $p$-values in brackets with 1,000 bootstrap replication. *** $\mathrm{p}<0.01$, ** $\mathrm{p}<0.05$, * $\mathrm{p}<0.1$ for standard $p$-values. ${ }^{a} \mathrm{p}<0.01,{ }^{b} \mathrm{p}<0.05,{ }^{c} \mathrm{p}<0.1$ for Romano-Wolf multiple hypothesis corrected $p$-values.
