**Abstract (resumen de 100-250 palabras)**

An increasing debate about taxing robots is taking place in our society as more jobs are being substituted by machines, driving workers to the unemployment. However, the replacement of workers is not new thing, it happened in the first industrial revolution i.e., but an ageing population and the structural unemployment are new variables the society must deal with. Therefore, a higher number of pensioners and unemployed are directing the viability of the social security funds into a risk of failure, for which the solution of taxing robots is being considered. For that, many options will be discussed and the application of one will be analyzed, by using a hypothetical overnight automatization of the cashier industry which will show how the society would be, or not, benefited.

**Materias o Palabras claves (máximo 5)**

Automatization, Robots, System, Tax, Unemployment.
