DEVELOPMENT OF A **TAXONOMY OF ACTIVITIES IN HEALTH PREVENTION AND PROMOTION FOR PRIMARY CARE**

Abstract

Aim: To develop a **taxonomy of activities in health prevention and promotion for primary care**.

Background: Despite health promotion being considered a keystone for population health and health care sustainability, its implementation remains insufficient. Customized evaluation tools are needed to address prevention and promotion omissions in primary care.

Method: A taxonomy was designed using documentary analysis. Documents **describing frontline primary care professionals' health prevention and promotion activities or omissions** were identified and analysed using framework analysis.

Results: The **'Taxonomy of Activities in Health Prevention and Promotion for Primary Care'** (TaxoPromo) includes 43 activities grouped into 8 categories: planification, situational analysis, capacity building, development of awareness/public opinion, advocacy, development of networks, development of partnerships, and intervention strategies.

Conclusion: By contrasting the usual practices with the activities collected in the TaxoPromo, **opportunities for improvement** can be unveiled.

1  
2  
3 Implications for Nursing Management: The TaxoPromo can be used at  
4  
5 organizational and system levels to identify actions to integrate health  
6  
7 prevention and promotion activities into a systematic, data-driven process;  
8  
9 design implementation plans and tailor-made strategies for capacity building;  
10  
11 enable benchmarking; and address omissions. The TaxoPromo can serve as a  
12  
13 catalyst tool for the clarification and expansion of the nursing role in health  
14  
15 prevention and promotion.

Review Copy

## Background

This article presents the first taxonomy of activities in health prevention and promotion for primary care and the research process conducted for its development. Best practices in this level of care can be identified when it is clear what health prevention and promotion entails.

## STATE OF PRACTICE

Health prevention and promotion is included in the service portfolio of the most solid healthcare systems. The provision and development of these services is considered a keystone for the protection, maintenance and improvement of population health and health systems' sustainability (Potvin & Jones, 2011). This assumption stems from recognising the potential of health prevention and promotion to impact health determinants, such as social circumstances, environmental conditions or behavioural choices (Jackson et al., 2006), which have been found to be behind a considerable percentage of early deaths (McGinnis et al., 2002) and to play a decisive role in the efficiency of health systems (Allin et al., 2015).

Nevertheless, the implementation of health prevention and promotion remains insufficient, variable and dependent on the involved professionals' willingness (Cabeza et al., 2016). This is evident in the case of nursing professionals. Despite being a highly competent professional group with a positive attitude towards health prevention and promotion (Wilhelmsson & Lindberg, 2009), their activity in this field is limited to a lifestyle approach through health education. Indeed, the literature reveals a shortage of nursing interventions that: (1) reflect WHO's recommendation to incorporate combinations of actions and strategies of the Ottawa Charter, which is necessary for the

1  
2  
3 interventions' effectiveness; or (2) specifically address the development of healthy  
4 environments, the support of communities in decision-making processes and collective  
5 action for health, the establishment of community collaborations and prescription of  
6 community assets or the development of healthy public policies (Iriarte et al., 2020).

10  
11

### 12 13 **THE COST OF THE LACK OF IMPLEMENTATION** 14

15  
16 The lack of health prevention and promotion implementation appears to have been  
17 accepted and normalised. In fact, health prevention and promotion omissions are rarely  
18 considered a patient safety issue, even though the harm they cause has already been  
19 documented (Woolf, 2004). A study on 27 OECD countries found that the main sources  
20 of harm in primary care were failures and delays in the detection and treatment of  
21 chronic diseases. By reducing patients' ability to manage their disease over time, these  
22 errors lead to the deterioration of their health status and an increased likelihood of  
23 hospitalization. In the countries investigated, counting only hospitalizations related to  
24 diabetes, hypertension, heart failure, chronic obstructive pulmonary disease and  
25 bronchiectasis, and asthma, this resulted in 2.7 million avoidable hospitalizations (2.6%  
26 of total admissions) in 2014 (OECD, 2018).

### 44 **ROOT CAUSES AND SOLUTIONS** 45

46 The origin of the lack of awareness regarding omissions in health prevention and  
47 promotion is multifactorial. The difficulty in assessing and demonstrating the impact of  
48 health prevention and promotion has generated scepticism about its effectiveness and  
49 certainty about the innocuousness of its omission. This has not helped in the  
50 development of an appropriate sense of accountability for health prevention and  
51 promotion (Rubio-Valera et al. 2014), especially in clinical settings where patient safety  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 is still incipient. The latter is the case with primary care, which is, paradoxically, the  
4  
5 setting with an explicit mandate for the provision of health prevention and promotion  
6  
7  
8 (Panesar et al., 2016).  
9

10  
11 The lack of awareness regarding omissions in health prevention and promotion can be  
12  
13 perpetuated if primary care bases the development of its patient safety systems on a  
14  
15 mere reproduction of those implemented in the hospital setting. These focus on the  
16  
17 management of errors related to acute and specialised medical care, which may differ  
18  
19 from those that occur in the care of the wellbeing, chronicity and prevention (Lutfey &  
20  
21 Freese, 2007; Allen-Scott, 2014). Furthermore, patient safety systems in the hospital  
22  
23 setting have the weakness of being overly focused on commission errors as opposed to  
24  
25 omission errors (Poghosyan et al., 2017).  
26  
27  
28  
29  
30

31 The agenda proposals for the advancement of patient safety in primary care recognize  
32  
33 the need to develop research, systems and tools customized for this clinical context  
34  
35 (Verstappen et al., 2015). The generalization of this opinion could give rise to a new  
36  
37 focus on advancing and standardizing health prevention and promotion. However, the  
38  
39 latest proposed tools for the study of safety in the specific field of primary care continue  
40  
41 to diminish health prevention and promotion and, in particular, health prevention and  
42  
43 promotion omissions, indicating that the problem remains unaddressed (See Table 1.).  
44  
45  
46  
47

48 Having identified this significant research and managerial gap, the authors set out to  
49  
50 develop the first taxonomy of activities in health prevention and promotion for primary  
51  
52 care.  
53

## Methods

The development of the taxonomy was conceived as the definition of a catalogue of activities that should be carried out by frontline health professionals to fully develop health prevention and promotion in primary care. Through a review of these activities, areas of improvement in health prevention and promotion can be identified, including neglected practices, or omission errors.

Four premises underlie this overall conception. The first relates to the understanding and usage of the umbrella term health prevention and promotion. Health prevention and health promotion are considered to overlap to some extent, especially in relation to primary prevention; however, the starting points and loci for action of the two differ. Furthermore, while the preventative component has a longer trajectory, there is a need to build capacity to develop and implement health promotion actions to promote health at the population level. To do so, it is necessary to shift the focus from illness to health and embracing intersectoral action and partnership working (EXPH, 2019). In this scenario, the taxonomy was built with a broad health promotion approach in an effort to explicitly include activities that can contribute to the improvement of individual and population health and not only to disease prevention.

The other three premises underlying the overall conception of the taxonomy reflect the need to keep it relevant and customised for primary care; helpful, in order to shorten the gap between theory and practice; and useful for managerial decision-making while engaging in frontline professionals.

To preserve this orientation, the incorporation of varied experts was deemed crucial. Thus, a researcher team comprising academics specialised in health prevention and

1  
2  
3 promotion, patient safety, community care, and healthcare management and frontline  
4  
5 primary care professionals was gathered to develop the taxonomy.  
6  
7

8  
9 After reviewing the existing patient safety taxonomies and classifications designed for  
10  
11 primary care and verifying that none of them had initiated the cataloguing of health  
12  
13 prevention and promotion best practices (see Table 1), the research team decided to  
14  
15 develop the taxonomy from scratch using documentary analysis (Hodder, 2003).  
16  
17

18  
19 Furthermore, the Ottawa Charter was taken as the theoretical framework. It defines five  
20  
21 actions that should be combined for the development of health prevention and  
22  
23 promotion: build healthy public policy, create supportive environments, strengthen  
24  
25 community actions, develop personal skills, and reorient health services (World Health  
26  
27 Organization, 1986). The charter also includes three strategies to deploy the actions:  
28  
29 advocate, mediate and enable. Fry and Zask's (2017) detailed definitions of the Ottawa  
30  
31 Charter's action areas were also considered to further operationalize the theoretical  
32  
33 framework. This theoretical framework guided the sampling, selection and analysis of  
34  
35 documents.  
36  
37  
38  
39  
40

41  
42 Purposeful sampling (Patton, 2002) was carried out based on the following criteria:  
43  
44 documents identifying omissions or activities in health prevention and promotion that  
45  
46 could be carried out by frontline primary care professionals either as their main  
47  
48 objective or as part of their theoretical or state-of-practice analysis of one or a  
49  
50 combination of Ottawa's actions. Documents that focused exclusively on preventive  
51  
52 care or practice in secondary care settings were excluded.  
53  
54  
55

56  
57 To identify the documents, team members carried out 5 bibliographic searches in  
58  
59 Medline, each with a specific keyword combination to locate records related to a specific  
60

1  
2  
3 action area of the Ottawa Charter. Searches were limited to English and Spanish and  
4  
5 within January 2007 to January 2018. The snowballing technique was applied. Table 2  
6  
7 details the search strategies and subsequent results.  
8  
9

10  
11 Once selected, the documents were analysed following a framework approach. The  
12  
13 framework approach offers a well-defined analytical process comprising five stages:  
14  
15 familiarisation, identification of a thematic framework, indexing charting, and mapping  
16  
17 and interpretation. This method was preferred because while it is heavily grounded in  
18  
19 data, it also facilitates the testing of *a priori* issues (Ritchie & Spencer, 1994).  
20  
21  
22

23  
24 To achieve familiarisation with the data, each team member read the documents they  
25  
26 had identified several times. Throughout these readings, key emerging issues in relation  
27  
28 to the nature of health prevention and promotion practice and its goals and outcomes  
29  
30 were listed. In a group meeting, the thematic framework was built using this information  
31  
32 and *a priori* assumptions offered by the theoretical framework adopted in the study.  
33  
34 Table 3 shows the thematic framework used to index the data. It included expanded  
35  
36 definitions of the 5 areas of action proposed in the Ottawa Charter and strategies for  
37  
38 the deployment of those actions. The expansion of the definitions of Ottawa Charter's  
39  
40 actions reflected the need to incorporate the insights gained in the familiarisation  
41  
42 analysis stage.  
43  
44  
45  
46  
47  
48

49 The analysis of the documents applying the thematic framework resulted in an initial list  
50  
51 of descriptive codes of the activities to be carried out by frontline professionals in  
52  
53 primary care within each of the 5 actions proposed by the Ottawa Charter. To develop  
54  
55 this list, individual researchers maintained the original terminology and added memos  
56  
57  
58  
59  
60

1  
2  
3 to retain their meaning and avoid distortions during the joint analysis meetings (Ritchie  
4  
5 & Spencer, 1994).

6  
7  
8 Indeed, all of the researchers gathered several times to present the initial coding, discuss  
9  
10 the relevance of the codes applied, detect duplications and the need for dividing or  
11  
12 combining codes.  
13  
14

15  
16 Once this second phase of coding was completed, the codes were lifted from the original  
17  
18 context (the specific Ottawa Charter action area) and rearranged into categories  
19  
20 according to type of activity. The team members' decision to opt for this categorization  
21  
22 scheme responded to the need to give practicality to the taxonomy. It also helped to  
23  
24 emphasize that health prevention and promotion is a process in which synergistically  
25  
26 related activities are integrated. Finally, the phase of mapping and interpreting  
27  
28 consisted of creating agreed explanatory descriptors of the categories and activities  
29  
30 included in each of them.  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40

## 41 **Results**

42  
43 Bibliographical searches and the application of the snowball technique yielded a total of  
44  
45 4321 documents. After contrasting the inclusion and exclusion criteria with titles,  
46  
47 abstracts and full texts, a total of 62 documents were included. The analysis of the  
48  
49 documents applying the thematic framework resulted in an initial list of 47 codes. Table  
50  
51 4 lists the codes after the first refinement stage.  
52  
53

54  
55 The Spanish version of the final **Taxonomy of Activities in Health Prevention and**  
56  
57 **Promotion for Primary Care (TaxoPromo)** can be found in Appendix 1 (the English and  
58  
59  
60

1  
2  
3 Portuguese versions can be obtained contacting the authors). TaxoPromo includes 43  
4  
5 health prevention and promotion activities grouped into 8 categories: planification,  
6  
7 situational analysis, capacity building, development of awareness/public opinion,  
8  
9 advocacy, development of networks, development of partnerships, and intervention  
10  
11 strategies that reveal health prevention and promotion as a process.  
12  
13  
14  
15

## 16 PLANIFICATION

17  
18  
19 This category includes 7 actions designed to formalise, structure and systematize  
20  
21 practice and capacity building within primary care. These actions should inform the  
22  
23 primary care centre managers and/or competent authorities in their decision making in  
24  
25 relation to the strategic planning of the primary care centres or systems.  
26  
27  
28

29  
30 More specifically, the actions included in this category involve the collaboration of  
31  
32 frontline health professionals in the establishment of short and midterm objectives for  
33  
34 health prevention and promotion within primary care centres, as well as in planning  
35  
36 activities oriented towards health improvement and/or the training of individuals and  
37  
38 communities. The planification category also includes planning activities directed at  
39  
40 improving organisational and workforce capacity for health prevention and promotion  
41  
42 practice, such as developing the evidence needed, contributing to the improvement of  
43  
44 the primary care centre's organization, collaborating on the identification of the primary  
45  
46 care centre's need for multidisciplinary development, taking part in the design of plans  
47  
48 for frontline professionals training in health prevention and promotion, and  
49  
50 collaborating in the identification of standards and competencies in health prevention  
51  
52 and promotion practice.  
53  
54  
55  
56  
57  
58  
59  
60

## SITUATIONAL ANALYSIS

This category has 4 activities designed to explore and understand the situation at individual, community and organizational levels, which will allow the formulation and planning of health prevention and promotion strategies and healthy public policies. The activities include evaluating the health status and health literacy of individuals and communities and assessing the environment surrounding those communities accounting for the use individuals make of them. To complete their participation in the situational analysis, frontline professionals should collaborate in the evaluation of the organizational context by identifying and assessing organizational factors that influence the achievement or execution of health prevention and promotion objectives, plans and activities in the primary care centre.

## ORGANIZATIONAL CAPACITY BUILDING

This category includes 4 activities directed at increasing and improving the allocation and coordination of the human, relational, material, structural and financial resources of primary care centres required for health prevention and promotion implementation. The first activity is to update competencies in health prevention and promotion by participating in training and scientific activities. The second is to identify community leaders or people who can use their influence for advancing health prevention and promotion due to the authority that the community has given to them. The third is to contribute to the advancement of health prevention and promotion theoretical bases and scientific evidence. The final activity is to collaborate in the formulation of a business case for health prevention and promotion.

## DEVELOPMENT OF AWARENESS/PUBLIC OPINION

The category of generating awareness/public opinion in individuals, communities and systems about the social determinants of health and their repercussions includes 6 activities. One activity is increasing individuals' and communities' awareness of healthy public policies, which also includes fostering community mobilization for the policies. Two additional important activities are contributing to the development of a sense of belonging among individuals in the community and promoting awareness about the interrelation of the environment and healthy lifestyles. Finally, frontline professionals must contribute to generating awareness among themselves regarding the impact of health prevention and promotion and systematically evaluate activities directed at generating awareness for health prevention and promotion.

## ADVOCACY

This category addresses the need for strategies inside and outside the health system that allow the promotion of health from the social determinants of health perspective and the issues that have an impact on them. The category includes 10 activities advocating for: safe and healthy environments, a community approach in primary care and programmes, community interventions, community-oriented-primary care and in health education programmes, activation and sustainability of community health councils or committees, and increasing resources for health prevention and promotion in primary care. Two more activities are included in this category: advocacy for the health sector's role in the construction of healthy public policies and the systematic evaluation of all advocacy activities carried out for health prevention and promotion.

## DEVELOPMENT OF NETWORKS

This category includes 4 activities for the development of community and social networks. One of these focuses on performing activities to encourage the relationships and social links between community members, which enhances the health of the population. Additionally, this category includes an activity aimed at identifying groups that promote the use of environments to perform health prevention and promotion activities and the socialization of individuals. Referring patients to community assets through social prescription and systematically evaluating the actions aimed at developing networks in health prevention and promotion are the last activities of the category.

## DEVELOPMENT OF COLLABORATIONS

This category comprises 4 activities that aim to identify key stakeholders for health prevention and promotion and build up collaborations with them. The activities are: regenerate community health councils, establish collaborations with key stakeholders for the construction of public policies and healthy environments, establish collaborations with research centres and universities for methodological support for advancing health prevention and promotion science, and collaborate in the systematic evaluation of the efforts carried out in the primary care centre for developing partnerships for health prevention and promotion.

## INTERVENTION STRATEGIES

This category includes 4 activities aimed at improving individuals' skills regarding health and the environments in which they live so that healthy behaviours are favoured. These activities are: provide brief advice for the promotion of healthy lifestyles, develop

1  
2  
3 individual or group health education programmes, develop community programmes  
4 that involve community members throughout the entire process and finally, design  
5 programmes that support a positive interaction of individuals with the environment. The  
6 development of health education and/or promotion programmes is, in turn, subdivided  
7 into five activities: planning, implementation, collaboration in clinical, cost-effectiveness  
8 and process evaluation.  
9  
10

19  
20

## 21 **Conclusions**

22  
23  
24 **TaxoPromo** is the first tool designed to guide systematic evaluations of health  
25 prevention and promotion practices in primary care. It offers a catalogue of 43 activities  
26 grouped into 8 categories that reflect the steps of the health prevention and promotion  
27 process: planification, situational analysis, capacity building, development of  
28 awareness/public opinion, advocacy, development of networks, development of  
29 partnerships, and intervention strategies. **Contrasting the usual practices with the**  
30 **activities collected in TaxoPromo, areas of improvement can be identified and**  
31 **prioritized.** These areas of improvement may relate both to the development,  
32 dissemination and facilitation of health prevention and promotion activities and also to  
33 dimensions that stand out for their frequency of omission and/or impact.  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48

49 **TaxoPromo** can be applied at the primary care organisation level or at the health care  
50 system level. **A way of using the taxonomy** could be to apply it at each primary care  
51 organization in regular meetings involving all members of the team to both review it and  
52 interpret in a global way the findings regarding specific **areas for improvement.** Using  
53 this methodology, at the primary care organisation level, the data can be used to (1)  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 design annual health prevention and promotion implementation plans or objectives; (2)  
4  
5 identify actions to integrate health prevention and promotion activities into a  
6  
7 systematic, consistent and data-driven process; (3) design tailor-made strategies for  
8  
9 capacity building in health prevention and promotion; and (4) enable benchmarking.  
10  
11

12  
13 Because data collection on health prevention and promotion practice at the primary  
14  
15 care organisation level can be systematized using **TaxoPromo**, data aggregation from  
16  
17 different primary care organisations in a region or even at the national level is possible.  
18  
19

20  
21 This exercise would allow for eliciting priority routes of action at the regional or state  
22  
23 level, but more importantly, it would allow for the establishment of capacity building  
24  
25 plans for health prevention and promotion in primary care and building the case for  
26  
27 better budgeting (Merkur et al., 2013). Evidence shows that nursing participation in  
28  
29 health prevention and promotion evaluation, strategic planning and the development  
30  
31 of healthy public policies is especially scarce (Iriarte et al., 2020). Having global data on  
32  
33 practice (which also contain and position nursing activity) can stimulate the interest and  
34  
35 ability of nurses in participating in these processes of analysis and decision-making. As  
36  
37 long as nursing does not take on these activities, care will continue to be under-  
38  
39 represented and under-resourced in healthcare organisations and systems (Rigolosi,  
40  
41 2013).  
42  
43  
44  
45  
46

47  
48 **TaxoPromo** can also be used as a catalyst tool for organisational learning and safety  
49  
50 culture. Omissions in health prevention and promotion may be due to role confusion or  
51  
52 a lack of knowledge or accountability (Rubio-Valera et al., 2014). Exposing professionals  
53  
54 to reviewing the dimensions and activities collected in **TaxoPromo** can help them  
55  
56 become more aware and knowledgeable about the variety of activities covered by  
57  
58  
59  
60

1  
2  
3 health prevention and promotion and, consequently, of opportunities for improvement  
4  
5 in this field. At the same time, this level of awareness can instigate a reflection on one's  
6  
7 own role in health prevention and promotion that, in turn, redound to the clarification  
8  
9 and expansion of the role and the development of a greater sense of accountability  
10  
11 (Olsen & Stensaker, 2014; Rubio-Valera et al., 2014). For nursing, the latter is especially  
12  
13 important, not only because role confusion has been identified as one of the main  
14  
15 causes of poor performance and burnout (Dasgupta, 2012), but also because the  
16  
17 expansion of its role in health prevention and promotion is a first-order goal nowadays  
18  
19 (Halcomb et al., 2016).  
20  
21  
22  
23

24  
25 Moreover, since **TaxoPromo** explicitly outlines planning aspects of both health  
26  
27 prevention and promotion activities and the organizational conditions mediating the  
28  
29 implementation of these activities, it enables healthcare professionals to become more  
30  
31 aware of their own role in building capacity for health prevention and promotion in  
32  
33 primary care. This managerial role of health professionals is gaining importance, given  
34  
35 the current tendency towards horizontalisation of organizational structures and  
36  
37 decision-making (De Brún et al., 2019). In the field of health prevention and promotion,  
38  
39 nurses are the professionals called to fill leadership positions (Whitehead, 2009;  
40  
41 Halcomb et al., 2016), so again, **TaxoPromo** can serve as a tool for the expansion of the  
42  
43 role of this profession.  
44  
45  
46  
47  
48  
49  
50

51 **Critically comparing novel taxonomies to existing research provides a method for**  
52 **evaluating their face validity (Szopinski et al., 2019). While, to the knowledge of the**  
53 **authors, there are no previous attempts to develop tools for the systematic evaluation**  
54 **of health prevention and promotion practice in primary care, there have been other type**  
55  
56  
57  
58  
59  
60

1  
2  
3 of research efforts directed at expanding health prevention and promotion and its  
4  
5 outcomes. A remarkable one is the Robert Wood Johnson Foundation's Culture of  
6  
7 Health Action Framework, which provides an operational scheme to catalyse work  
8  
9 toward improved population health, well-being and equity in America (Chandra et al.  
10  
11 2016). This framework includes four action areas: Making Health a Shared Value,  
12  
13 Fostering Cross-Sector Collaboration to Improve Well-Being, Creating Healthier, More  
14  
15 Equitable Communities and Strengthening Integration of Health Services and Systems,  
16  
17 that cluster themes common across the datasets analysed for its development. The fact  
18  
19 that these areas and themes find a close reflection in the categories and activities  
20  
21 included in TaxoPromo provides support for its face validity (Szopinski et al., 2019).  
22  
23  
24  
25  
26  
27

28 **Another** aspect that may have strengthened the validity of the tool is the fact that the  
29  
30 research team was composed of both academics with varied expertise and frontline  
31  
32 primary care professionals. Specifically, this aspect provided balance to the debate when  
33  
34 judging what activities could indeed be attributed to frontline professionals and also  
35  
36 whether such activities are aimed at the direct attention of individuals and populations  
37  
38 or at capacity building for health prevention and promotion. **Nevertheless**, future  
39  
40 research should aim to **further** validate this tool, especially in primary care settings other  
41  
42 than the Spanish context.  
43  
44  
45  
46  
47

48 **TaxoPromo has limitations. First, it only allows us to study the practice by frontline**  
49  
50 **professionals, although improvements can also be catalysed by managers and planners**  
51  
52 **of the healthcare system. Lapses** in system design and management can represent latent  
53  
54 conditions, which Reason (2016) considers **the riskiest**, given their insidious nature. The  
55  
56 inclusion of health prevention and promotion activities to be carried out by those  
57  
58  
59  
60

1  
2  
3 involved in the planning and management of primary care organisations in the  
4  
5 **TaxoPromo** was ruled out because, such inclusion might potentially reduce the  
6  
7 practicality of the tool. Thus, in future research, other complementary taxonomies could  
8  
9 be developed to examine these **activities**. The creation of checklists, classifications or  
10  
11 models **that help analyse root causes of practices and omission and commission errors**  
12  
13 **in** health prevention and promotion, are other areas that deserve the attention of  
14  
15 researchers and managers involved **in improving practice and** safety in primary care.  
16  
17

18  
19  
20 **Nevertheless, the use of the TaxoPromo can set the scene for primary care professionals**  
21  
22 **to relaunch health prevention and promotion avoiding focusing only on the direct**  
23  
24 **interaction with patients and families but instead also looking at their involvement at**  
25  
26 **the organizational level and the general community context they are working**  
27  
28 **with/within. This is useful for identifying and leveraging the work that nurses and other**  
29  
30 **frontline primary care professionals are actually doing in health prevention and**  
31  
32 **promotion and minimising the actions they are missing.**  
33  
34  
35  
36  
37  
38  
39  
40  
41

Table 1. Tools for the study of patient safety in primary care: Representation of health promotion and prevention best practices and omissions

TOOL/ OBJECTIVE / REFERENCE	DOES IT PAY ATTENTION TO...	
	...Health promotion and prevention?	...Omissions?
<p><b>Patient Safety Incident Classification for Primary Care (PSIC-PC)</b></p> <p>To collect and analyse patient safety data derived from various sources but originated in primary care.</p> <p>Klemp, K., Dovey, S., Valderas, J. M., Rohe, J., Godycki-Cwirko, M., Elliott, P., Hoffmann, B. (2015). Developing a patient safety incident classification system for primary care. A literature review and Delphi-survey by the LINNEAUS collaboration on patient safety in primary care. <i>European Journal of General Practice</i>, 21, 35-38. doi: 10.3109/13814788.2015.1043723</p>	1 out of 9 items of the category "Incident related to clinical task" refer to prevention.	✘
<p><b>International Classification for Patient Safety</b></p> <p>To enable categorization of patient safety information using standardized concepts.</p> <p>World Health Organization: World Alliance for Patient Safety, Taxonomy (2009) The Conceptual Framework for the International Classification for Patient Safety. Final Technical Report. Version 1,1. Retrieved from: <a href="http://www.who.int/patientsafety/implementation/taxonomy/en/">http://www.who.int/patientsafety/implementation/taxonomy/en/</a></p>	1 out of 13 subcategories of incident types refers to "Patient Accidents". 9 out of 42 items of the "Nutrition", "Clinical Process/Procedure", "Clinical administration" subcategories may be interpreted in relation to health promotion and prevention.	3 references throughout the tool in relation to 3 subcategories of incident types: "Clinical Process/Procedure", "Documentation" and "Clinical administration"
<p><b>Poghosyan et al. (2017) Typology of errors of omission</b></p> <p>To categorize errors of omission from the primary care providers' perspective and to understand what factors within practices led to/ prevent them.</p> <p>Poghosyan, L., Norful, A. A., Fleck, E., Bruzzese, J. M., Talsma, A. N., &amp; Nannini, A. (2017). Primary care providers' perspectives on errors of omission. <i>Journal of the American Board of Family Medicine</i>, 30(6), 733-742. doi: 10.3122/jabfm.2017.06.170161</p>	1 theme out of 4 refers to "Patient teaching". 1 extra item refers to Health Prevention "Depression screening"	✔
<p><b>Stocks et al. (2018) Survey</b></p> <p>To measure the frequency of occurrence of potentially harmful preventable problems in primary care from the patient's perspective.</p> <p>Stocks, S. J., Donnelly, A., Esmail, A., (2018) Development and piloting of a survey to estimate the frequency and nature of potentially harmful preventable problems in primary care from a UK patient's perspective. <i>BMJ Open</i>, 8: e017786. doi: 10.1136/bmjopen-2017-017786</p>	1 out of 17 items regarding preventable problems refer to Health Prevention ("Not offering prevention or screening programmes").	4 items ("Wrong or late diagnosis", "Not referred for further investigation", "Not referred to a specialist", "Not offering of prevention or screening programmes").
<p><b>Threats to Australian Patient Safety (TAPS) taxonomy</b></p> <p>To describe patient safety events in general practice.</p> <p>Makeham, M.A.B., Stromer, S., Bridges-Webb C, et al. (2008) Patient safety events reported in general practice: a taxonomy. <i>Qual Saf Health Care</i>, 17, 53-57.</p>	2 items refer to immunisations ("Errors in the process of providing immunisations", "Knowledge or skills errors in undertaking immunisations").	✘

Table 3. Thematic framework

OTTAWA CHARTER ACTION AREA EXPANDED DEFINITION	HEALTH PROMOTION AND PREVENTION ACTIVITY	
<p><b>BUILDING HEALTHY PUBLIC POLICY</b></p> <p>Government (international, national, state and local) involvement (Leadership) in cross-sectoral partnerships and actions, including steering communities and civil society, that advocate, establish and/or implement population-wide improvements of health and/or conditions of daily life.</p>	Planning and managing health-enhancing <b>structures</b>	Build cross-sectoral partnerships
		Steer communities and civil society
		Develop health-enhancing cross-sectoral policies
		legislation measures regulation measures fiscal measures
	Planning and managing health-enhancing <b>mechanisms</b>	Build cross-sectoral partnerships
		Steer communities and civil society
		Develop health-enhancing cross-sectoral policies
		legislation measures regulation measures fiscal measures
	Planning and managing health-enhancing <b>actions</b>	Build cross-sectoral partnerships
		Steer communities and civil society
		Develop health-enhancing cross-sectoral policies
		legislation measures regulation measures fiscal measures
<p><b>CREATING SUPPORTIVE ENVIRONMENTS</b></p> <p>Developing physical and/or social environments in ways that support health and protect against physical hazards and socially and psychologically damaging practices. This can be done by changing physical or social environments, by organizational change, or by offering additional infrastructure, programmes or services. Physical environments encompass the natural and built environments, and social environments encompass psycho-social, economic and cultural environments. Steps to create supportive environments can be taken by individuals, community groups, organizations and governments and can take place at structural, social and personal levels.</p>	Changing <b>natural</b> environments	Individuals at: personal level social level structural level
		Community groups at: personal level social level structural level
		Organisations at: personal level social level structural level
		Governments at: personal level social level structural level
	Changing <b>built</b> environments	Individuals at: personal level social level structural level
		Community groups at: personal level social level structural level
		Organisations at: personal level social level structural level
		Governments at: personal level social level structural level

OTTAWA CHARTER ACTION AREA EXPANDED DEFINITION	HEALTH PROMOTION AND PREVENTION ACTIVITY		
	Changing <i>psycho-social</i> environments	Individuals at:      personal level ----- social level ----- structural level	
		Community groups at:      personal level ----- social level ----- structural level	
		Organisations at:      personal level ----- social level ----- structural level	
		Governments at:      personal level ----- social level ----- structural level	
	Changing <i>economic</i> environments		Individuals at:      personal level ----- social level ----- structural level
			Community groups at:      personal level ----- social level ----- structural level
			Organisations at:      personal level ----- social level ----- structural level
			Governments at:      personal level ----- social level ----- structural level
	Changing <i>cultural</i> environments		Individuals at:      personal level ----- social level ----- structural level
			Community groups at:      personal level ----- social level ----- structural level
			Organisations at:      personal level ----- social level ----- structural level
			Governments at:      personal level ----- social level ----- structural level
<b>Organizational</b> change		Individuals at:      personal level ----- structural level	
		Community groups at:      structural level	
		Organisations at:      structural level	
		Governments at:      social level ----- structural level	
Offering additional <i>infrastructure,</i> <i>programmes</i> or <i>services</i>		Individuals at:      social level	
		Community groups at:      social level	
		Organisations at:      personal level ----- social level ----- structural level	
		Governments at:      personal level ----- social level ----- structural level	

OTTAWA CHARTER ACTION AREA EXPANDED DEFINITION	HEALTH PROMOTION AND PREVENTION ACTIVITY	
<b>STRENGTHENING COMMUNITY ACTION</b>  Expanding the resources and capacity of communities to make decisions and take collective action to empower citizens over the determinants of their health. Actions can include developing programs or networks for capacity building, and advocacy for service or community participatory programme improvements, organizational change and/or for public policy change.	<b>Development</b> of:	Programmes
		Networks
	<b>Advocating</b> for:	Service improvements
		Programme improvements
Organizational change		
<b>DEVELOPING PERSONAL SKILLS</b>  Enabling individuals to understand and critically use health information and to develop skills to improve their health. This is often but not necessarily done through educational processes and/or by increasing health literacy. Developing personal skills includes developing the capacity of individuals to assess their health needs and to identify possible changes to their own actions and the wider environment.	<b>Educational processes</b>	To enable: Understanding of health information ----- Using health information critically ----- Assessment of personal health needs ----- Identification of changes to personal actions ----- Identification of changes to the wider environment
		Increasing <b>health literacy</b>
<b>REORIENTING HEALTH SERVICES</b>  Developing the capacity of health systems and programmes to achieve improved population health and health equity, and enabling all people to move along the health-illness continuum in the direction of health. Actions to develop/ reorient health programmes and services to HPP include increasing infrastructure and resources for HPP, extending HPP attention to new issues and strategies, adding health promotion and early intervention components to clinical services, and adapting clinical services. These actions can take place at structural, organizational and service levels.	Increasing <b>infrastructure</b> for HPP	Structural level
		Organizational level
		Service level
	Increasing <b>resources</b> for HPP	Structural level
		Organizational level
		Service level
	Extending HPP <b>attention to new issues/ strategies</b>	Structural level
		Organizational level
		Service level
	Adding <b>health promotion</b> and <b>early intervention components</b> to services	Structural level
		Organizational level
		Service level
<b>Adapting</b> clinical services	Structural level
